

PROGRESS REPORT

- **What was achieved last week?**

What was achieved in the last week is that I moved to a new repository and made a new project from there. I started from scratch and was able to create entities that are almost AI free. Almost because AI was still used as a guide. I was able to implement the Models, DTOs, Repositories, and Services of 4 different entities (Student, Teacher, Course, Attendance).

- **What is the focus of today?**

The focus of today was to fully finish the Service folder and all its needed files for the different entities.

- **What blockers exist?**

My main issue while writing the code myself is the proper syntax to use. There are times where Visual Studio will generate a code for me to Tab and it is very useful. However, there are times where it causes mismatches which causes errors in the code. This leads me to turn to AI and help me search the error in my code in which I was not able to notice.

- **What went well?**

I successfully implemented Models, DTOs, Repositories, and Services. Whats left is to create the Controllers.

- **What didn't go well?**

Mismatch of syntax that causes errors.

- **What should we start doing?**

Complete the necessary requirements for each part (Frontend and Backend)

- **What we should stop doing?**

Less communication on what fields are needed and asked for.

- **What we should continue doing?**

Make sure that the system is always updating and not stagnant.
