

PROGRESS REPORT

STAND-UPS:

1. What was achieved last week?

- Last week, our team decided that we would not rely on AI and instead use basic coding for our Frontend and Backend. Initially, we planned to rely on AI, but we changed our minds.

2. What is the focus for today?

- Today we are concentrating on the finalization and optimization phase of the project based on our recent progress.

Backend - We are completing the remaining backend functions, refining authentication and database operations, and ensuring all security measures such as hashing and rate limiting work properly.

Frontend - We are polishing the frontend design to improve responsiveness, usability and overall appearance across different devices.

System Integration - We are connecting and testing all remaining modules, including QR code scanner, email notification system, and real time alerts to ensure every feature works seamlessly together.

3. What blockers exist?

- Right now, this week is ensuring that all frontend and backend components are integrate smoothly during the finalization phase. Since multiple features are being tested simultaneously, small changes can sometimes create unexpected issues that require additional debugging and adjustments.

RETROSPECTIVE:

1. What went well? (Wins/Successes)

- Our team made significant progress in completing the system's major functionalities. Communication and collaboration improved throughout the week, allowing us to solve issues faster and keep development organized. The integration between the frontend and backend is now more stable, making the project closer to completion.

2. What didn't go well? (Problems/Challenges)

- Some final integrations and debugging tasks took longer than expected because certain features conflicted with one another during testing. We also encountered minor issues while optimizing performance and ensuring compatibility across different devices and system modules.

3. What should we start doing? (Improvements)

- We should begin performing more frequent integration testing after every completed feature to immediately identify and resolve issues. This will help reduce delays and make the finalization process more efficient.

4. What should we stop doing? (Waste/Inefficiencies)

- We need to stop making isolated updates without informing the rest of the team. Since the system is now heavily interconnected, every small modification can affect other parts of the application if not communicated properly.

5. What should we continue doing? (Best practices)

- We should continue practicing clean coding, consistent communication, and daily progress monitoring. These practices have helped the team stay organized and productive while finalizing both the frontend and backend of the project.
